

Project Proposal: Super Store Analytics

Data-Driven Performance Dashboards & Business Intelligence Solution

Prepared for: Management Team & Stakeholders | Date: July 2026

1. Executive Summary

This project delivers a comprehensive, interactive data analytics solution for "Super Store" by developing four specialized dashboards: **Overview, Customer Analytics, Employee Performance, and Territory Analysis**. These dashboards integrate core business metrics (Sales, Profit, Quantity) with granular dimensions (States, Buying Groups, Time, Cities) to empower management with actionable insights for optimizing sales strategies, increasing profitability, and enhancing operational efficiency.

2. Problem Statement & Opportunities

Currently, interpreting Super Store's business performance is a complex, time-consuming process. Management faces concrete challenges in identifying key growth drivers and resource leaks:

- **High-Level Visibility:** Difficulty in identifying at-a-glance the key drivers of the \$22.86M in Total Sales and \$9.92M in Total Profit.
- **Customer Value Optimization:** A lack of granular segmentation across the 49 distinct customers to systematically maximize their \$375.95 Average Profit Per Customer.
- **Performance Disparities:** Challenges in accurately comparing individual performance among the 19 total employees based on both volume and profitability metrics.
- **Regional Granularity:** Missing localized insights among the 153 active cities beyond the high-level state overview, leaving potential growth markets hidden.

3. Project Objectives & Scope

The project delivers four interconnected dashboard pages designed to answer specific strategic business questions:

Dashboard 1: Super Store Analysis (Overview)

Objectives & Scope: Provide a high-level summary of corporate business health. Visualize key top-line KPIs including Total Sales (Including Tax), Total Profit, Profit Margin (43.42%), Total Orders (26K), Total Quantity (1M), and Average Order Value (\$865.82). Track performance trends over months and highlight key geographical contributors (e.g., California's \$10M in Sales) and top-level customer segments (Buying Groups, e.g., Tailspin Toys driving 61.46% of sales).

Dashboard 2: Customer Dashboard

Objectives & Scope: Enable deep-dive customer segmentation and identify high-value accounts. Track total customer count and average profit per customer. Highlight key operational drivers, such as the most profitable buying group (Tailspin Toys) and most profitable customer (Wingtip-San Jacinto, CA). Rank top 10 customers by both Quantity and Total Profit to identify volume-heavy vs. profit-rich accounts, supported by a transactional Summary Matrix for anomaly detection.

Dashboard 3: Employee Dashboard

Objectives & Scope: Measure and compare individual sales force efficiency. Track total employees against active sales employees. Highlight star performers, specifically identifying the Best Selling Employee (Sophia Hinton) and Top Selling Employee By Volume (Kayla Woodcock). Provide direct peer comparisons using targeted distribution charts for both Total Quantity and Total Profit by individual to motivate sales force alignment.

Dashboard 4: Territory Dashboard

Objectives & Scope: Map regional performance and identify untapped growth markets. Map 153 Active Cities and their Average Sales Per City. Identify the most profitable city (Akhiok) and state (California). Compare average order size by state (Oregon leading at 40) and rank the top cities by Profit Margin (Meadowdale leading at 47%). A distinct Total Profit Treemap will visually demonstrate profitability concentration across the territories.

4. Methodology & Data Infrastructure

To ensure a robust and scalable architecture, development follows a structured data engineering workflow:

- **Data Connection:** Establish reliable data ingestion from standard corporate data sources (CRM, Databases, or ERP systems containing Sales, Customer, and Location records).
- **Data Modeling & ETL:** Perform data cleaning, normalization, and transformation (e.g., combining tax-inclusive sales figures, aggregating employee metrics). Formulate clean dimensional relationships to optimize calculation speed.
- **Dashboard Design:** Build responsive, interactive visual interfaces with a unified dark blue/white theme, leveraging optimized bar charts, line trends, buying group matrices, and treemaps.
- **Validation & Deployment:** Conduct end-to-end data auditing across all interconnected dashboards and securely deploy the architecture for management access.

5. Expected Business Impact (ROI)

Strategic Outcomes: This business intelligence project transforms raw records into clear, defensive growth strategies, ensuring a rapid return on investment through clear operational pillars:

- **Revenue Growth:** Maximizing focus and investment in high-margin regions (e.g., Meadowdale) and with high-value customer cohorts.
- **Profitability Optimization:** Instantly analyzing and rectifying transactions that result in negative profit (as identified in the Customer Summary matrix).
- **Workforce Efficiency:** Aligning performance incentives with net profitability metrics and replicating best practices from top performers to underperforming staff.
- **Strategic Expansion:** Confidently scaling up business operations in high-performing states like California and Washington using data-backed evidence.
